

The V6.2 Optimization Landscape (Corrected Physics)

How widening the bounds + correcting the physics uncovered the dodecagon optimum at 74.17 kg

1. Convergence: 60 Islands → Global Optimum

Multi-island DE with periodic migration escapes local minima

2. Polygon Effect: n_{lines} vs Mass

More lines = thinner beams = smaller knuckles = lower total mass

3. Density Profile: β Sign Flip

Corrected physics shifted the optimum from $\beta = +0.76$ to $\beta = -0.13$

4. Expansion Rotors: n_{exp} vs Mass

More expansion stations add mass — the optimum is $n_{exp} = 1$
