

Every segment of the winner runs far below its over-twist limit

Transmitted twist against δ_{crit} · shaft profile S1-S5, ground to hub · island-3 winner operating point

A — twist: transmitted twist $|\Delta\alpha|$ against its δ_{crit} over-twist limit

B — torque: segment torque against torsional capacity, paired at the same state

● transmitted twist (panel A) ● segment torque (panel B) | δ_{crit} over-twist limit □ torsional capacity

realisability floor — $\sin \Delta\alpha \leq 1/1.05$ holds the geometry only to 72.25° .

crossing limit $\delta\alpha^*$ — every segment gates on its own collapse-detector limit. That limit is not the over-twist limit.

The 2026-08-13 winner ran to $22,425^\circ$ (62 revolutions) against its 42.6° limit — off scale.

read cap — the former 90° asin clamp is removed. Reads are uncapped.

no limit — the segment's tether is shorter than the sum of its end radii. Its lines cannot reach the axis,

so no over-twist limit exists. Tether break strain and ring compression carry the limit instead.
