

# Why the Density Profile Inverted: From Bottom-Heavy to Top-Biased

$\beta$  controls ring spacing:  $\beta > 0$  = bottom-heavy,  $\beta < 0$  = top-bias. The optimizer freely chooses  $\beta \in [-0.8, +0.8]$ .

$n=3 \rightarrow n=12$

$\beta$  sign flips from  $+0.76$  to  $-0.13$
